We study the possibility of transferring quantum states from one quantum system to another by using quantum time-delay interferometry. The method is based on the generation of two biphotons in spontaneous

parametric down conversion. These quantum pairs are then split and recombined using two highly reflective mirrors. Depending on the distance between the two mirrors the time delay between the two photon pairs is modified and, therefore, the entangled quantum state evolves in time. We describe how the process of passive quantum state transfer can be achieved by exploiting the time-dependent quantum interference between the biphotons. We present a detailed theoretical model which is consistent with recent experimental results and show that the scheme is feasible with current technology.Q: Searching for text in paragraph I want to make a simple script that would search for a word or a sentence in a paragraph. so far, I've been able to make a script that finds the beginning and the end of a line: with open("data.txt") as f: for line in f: if "this text" in line: print(line.split(" ")[1]) This works. If the text is not in

the first line, then it skips it and goes to the next line. But, I want it to scan every line and print the one that contains the text, not just the line that the text was in. This is what I have for now. I use this to get the index of the line and print the line. with open("data.txt") as f: for line in f: for num in range(len(line)): if "this text" in line: print(line) A: with open('data.txt', 'r') as f: for line in f: for num in range a1d647c40b
