Proteomic features and immunomodulatory effects of polyphenolic compounds from the root of manuka (*Leptospermum scoparium*) under heat stress conditions. The aim of this study was to identify the cellular mechanisms associated with polyphenol-mediated protection against hyperthermia (HT) exposure. Using a quantitative proteomics approach, we compared the protein expression profiles of HepG2 cells treated with *Leptospermum scoparium* (LSA) and controls to provide insight into the molecular mechanisms that underlie the protective effect of LSA against HT exposure. The results revealed unique protein expression profiles in the cells after treatment with LSA. We identified significant changes in proteins implicated in a number of biological processes, such as antioxidant activity, defense response, and cell cycle control. These changes reflect the role of LSA in decreasing reactive oxygen species (ROS), improving cell membrane damage, and increasing the number of cells in the early S phase of the cell cycle. In addition
