is installed on a computer that already has a version of JDK 8 Update 120 installed, existing updates will be automatically removed. 32 bit and 64 bit Oracle
JDK/JRE for Linux are available. 8u113, KB2501822, and fix for the January .1. Field of the Invention This invention relates to a method of and apparatus for
measuring tensile and compressive stresses, and particularly to a method and apparatus for measuring stresses occurring in or in connection with the drawing
of metals. 2. Description of the Prior Art Tensile and compressive stresses can arise either during or after drawing operations. In a metal or like workpiece or
member, for instance, relatively large stresses can be created by one or more prior deforming procedures such as casting and homogenizing, hot rolling, cold
rolling, annealing or heat treating, bending, and grinding. Such stresses are of particular importance when they are at or near the yield point. If stresses
remain in the range of the yield point or if the yield point is exceeded during further processing of the workpiece, the workpiece will exhibit a failure that may
be determined by fracture, softening, or thermal transformation of the workpiece. Independently or jointly, die thickness, feed rate, speed of traverse, and
cross-sectional area are the principal mechanical factors that govern the yielding of a metal under load. Additionally, the residual stresses in the workpiece
affect its degree of stability. In certain cases, the yield point may be modified by the application of heat or plastic deformation. It is important to determine the
stresses that the workpiece is undergoing. This can be achieved by the use of an eddy current device that is suitable for the purpose. With the US Constitution
and the Bill of Rights long dead, and so too the rather breathless claims of civil libertarians and Marxist professors of the 1960s that "a few more decades and

2017. Login or create an account to link your online community account to your customized Mozilla Network URL/handle, avatar, and biography. Ericsson has
launched an end-to-end Software-as-a-Service based Development suite based on its well-established Freedom SDK, offering developers an open source
hardware, software and services development platform. The new suite, called CSP (Collaborative Software Development) is part of Ericsson's wider vision of
developing a Software-as-a-Service based development environment that supports service, cloud and mobile applications and has them share common APIs.
CSP is designed for application development across a range of device types, from handheld to vehicle to UTM, for both existing and new types of application
domains. At the core, CSP is a set of libraries, services and tools for building/developing open source collaborative software. The suite includes: an integrated
development environment supporting cross-platform application development; a software service for building applications based on a shared design template
and real-time models of individual project actors; a common object model for service-oriented applications; shared components and services to extend the
range of supported application domains; and a collaboration environment with a shared directory structure and sharing of source code. The suite was
developed by Ericsson and is based on the Freedom SDK and Freedom Developer Studio (FDS). Pricing and Availability CSP is available from June 2017 as a
