A: Try this. library(XML) data 1. Field of the Invention This invention relates to motion picture cameras, and more particularly to an automatic exposure control system for a motion picture camera having a single shutter which is opened and closed in response to both a standard photographic exposure setting such as ASA, ISO, or EI and a photographic exposure setting such as SECOM. 2. Description of the Prior Art Most motion picture cameras automatically vary the camera aperture and shutter speed in accordance with the brightness of the scene being photographed. The prior art also shows other camera settings which may be varied in accordance with the brightness of the scene being photographed. See, for example, U.S. Pat. Nos. 3,656,826, 3,698,903, and 3,709,719. In addition to automatic exposure control, the motion picture industry has developed a standard photographic exposure setting for motion picture cameras, particularly 35 mm. cameras,

---

which is denoted by SECOM. The SECOM setting is typically used to control the camera exposure to provide a constant brightness on photographic film, either for a constant light intensity or for a constant black-and-white density per unit area of film. Other photographic exposure settings which also provide a constant brightness on film include ASA, EI, and ISO. For further background information regarding the SECOM setting, reference is made to U.S. Pat. Nos. 3,652,724, 3,714,928, 3,864,000 and 3,898,498. In addition to control of photographic exposure during the exposure cycle, the prior art also shows a method for controlling exposure during the exposure cycle by varying the camera exposure setting from normal or optimal, as denoted by "ON" or "OFF", to minimum or maximum, as denoted by "1" or "0". Such a system is generally provided with a memory such that the photographic exposure setting is stored in the memory prior to the first exposure cycle
