Operative system support AutoCAD runs on most of the Windows, Mac, and Unix operating systems, although Linux support is limited to the use of the .NET Framework. For compatibility with various third-party CAD software, AutoCAD supports OLE automation. Interoperability with other CAD software AutoCAD is designed to export to a variety of CAD formats including the following: IGES, STEP, and Parasolid (formerly known as ACIS). An example of this is the ability to export to Parasolid as well as use Parasolid commands within the drawing. AutoCAD can be run from within a number of third-party CAD software applications. Microsoft Windows applications such as AutoCAD R14 and AutoCAD LT allow for the seamless integration of third-party CAD software within AutoCAD. This integration is achieved by communicating with an AutoCAD server application which resides on the AutoCAD LT or AutoCAD R14 server. These servers can be run on Windows and Unix systems. The server application can control up to sixteen concurrent instances of AutoCAD LT or AutoCAD R14. This feature can be used to minimize the amount of time spent processing and displaying the drawing. AutoCAD LT and AutoCAD R14 are not open source software. AutoCAD LT was initially released as an add-on to AutoCAD LT version 2009 and AutoCAD R14 was released as an add-on to AutoCAD R14. Current versions of AutoCAD LT and AutoCAD R14 include full source-code. In the case of AutoCAD, it is possible to work in a virtual environment that runs both Autodesk product and third-party product. All source code is available under the GNU General Public License, version 2.0. Rendering AutoCAD is capable of exporting drawings directly to an animated video format, Adobe Flash for example, with native text or vector-based objects. These files can be played back in a web browser, including mobile devices such as iPads and iPhones. AutoCAD has its own real-time rendering engine, named Rhinoceros 3D, which is capable of creating and editing (including modifying and applying textures) interactive 3D models. It is most commonly used for rendering 3D artwork or animations for non-photorealistic rendering (NPR) purposes. Video-based rendering is useful for reviewing an animation ca3bfb1094

Field of the Invention The present invention relates generally to the field of corn breeding. In particular, the invention relates to corn seed and plants of the hybrid variety designated CH188097, and derivatives and tissue cultures thereof. 2. Description of Related Art The goal of field crop breeding is to combine various desirable traits in a single variety/hybrid. Such desirable traits include greater yield, better stalks, better roots, resistance to insecticides, herbicides, pests, and disease, tolerance to heat and drought, reduced time to crop maturity, better agronomic quality, higher nutritional value, and uniformity in germination times, stand establishment, growth rate, maturity, and fruit size. Breeding techniques take advantage of a plant's method of pollination. There are two general methods of pollination: a plant self-pollinates if pollen from one flower is transferred to the same or another flower of the same plant. A plant cross-pollinates if pollen comes to it from a flower on a different plant. Corn plants (*Zea mays* L.) can be bred by both self-pollination and cross-pollination. Both types of pollination involve the corn plant's flowers. Corn has separate male and female flowers on the same plant, located on the tassel and the ear, respectively. Natural pollination occurs in corn when wind blows pollen from the tassels to the silks that protrude from the tops of the ear shoot. Plants that have been self-pollinated and selected for type over many generations become homozygous at almost all gene loci and produce a uniform population of true breeding progeny, a homozygous plant. A cross between two such homozygous plants produces a uniform population of hybrid plants that are heterozygous for many gene loci. Conversely, a cross of two plants each heterozygous at a number of loci produces a population of hybrid plants that differ genetically and are not uniform. The resulting non-uniformity makes performance unpredictable. The development of uniform corn plant hybrids requires the development of homozygous inbred plants, the crossing of these in
